Helping patients adjust to CPAP on their own

Adding V-Com to a patient's therapy is like Training Wheels for CPAP™. This simple device can mean the difference between your patient giving up on PAP or continuing their lifesaving treatment.

Within minutes, a respiratory therapist can show a patient what the PAP pressure feels like with and without the V-Com device inline. This feedback mechanism allows them to better understand how their airflow should feel.

As you know, comfort equals adherence and adherence equals better treatment outcomes.

The V-Com Difference

Improve early PAP tolerance with V-Com by providing your patients with initial comfort without compromising their treatment.

Traditionally, when a patient struggles with the constant flow of air pressure, pressure settings are reduced.

Reducing pressure settings to increase a patient's initial tolerance improves comfort, but at a cost.

Decreasing pressure settings also means decreasing expiratory positive airway pressure (EPAP) which is principally responsible for therapy.

The V-Com effect is flow-dependent with its maximum comforting effect during the high inspiratory flows. As a result, V-Com has minimal effect on expiratory positive airway pressure.

With Nasal High Flow (NHF) therapy, patients benefit from warmed, humidified oxygen at a flow rate greater than those seen with conventional oxygen delivery devices, and more than peak inspiratory airflow. NHF treatment is better tolerable due to the heated and humidified air. The NHF apparatus is also smaller and more comfortable on the face than an NIV mask. Patients can continue eating, drinking and talking during treatment, leading to higher compliance. Delivery respiratory gases range from 2 - 60 L/min and O2 concentrations range from 21 - 100%. NHF is intended for patients in homes and long-term care facilities and may help prevent intubation.

Deluxe Closed Ventilation Suction System

Suction Control Switch

Ergonomic suction control switch with a built-in security lock to visually determine if the device is in the OFF/ON position. Offers a quick and easy, single handed operation design, which allows you to keep your eye on the patient and do no harm. One handed operation allows the free hand to support the ET or Trach device to ensure less trauma to the site.

Catheter Tip

Atraumatic rounded catheter tip for minimal tracheal wall injury.

MDI Port provides access for drug delivery as needed. Large and easy to grip port allows for rapid medication introduction.

Irrigation Port offers a one-way valve to prevent backflow leakage and easy access for cleaning the closed suction system.

Isolation Valve seals the irrigation chamber to provide a better cleaning of the catheter. Allows for continuous ventilation and prevents backflow of saline during cleaning to ensure patient comfort and safety.

Black Ring Indicator ensures that the catheter is properly withdrawn from the ET or Trach device. Black ring must be visible in the plastic sheath after suctioning the patient.
